ABSTRACT

A working group coordinated by the World Health Organization (WHO) convened to develop a set of indicators to protect children’s health from environmental risks and to support current and future European policy needs. Based on the identified policy needs, the group developed a core set of 29 indicators for implementation plus an extended set of eight additional indicators for future development focusing on exposure, health effects and action. As far as possible, the indicators were designed to use existing information and are flexible enough to be further developed to meet the needs of policy-makers and changing health priorities. These indicators cover most of the priority topic areas specified in the Children’s Environment and Health Action Plan for Europe (CEHAPE) as adopted in the Fourth Ministerial Conference on Health and Environment in 2004, and will be used to monitor the implementation of CEHAPE. This effort can be viewed as an integral part of the Global Initiative on Children’s Environmental Health Indicators, launched at the World Summit on Sustainable Development (WSSD) in 2002.
INTRODUCTION

Approximately a quarter of the global burden of disease can be attributed to environmental factors (Prüss-Ustün and Corvalán, 2006). Children under the age of 5 bear over 40% of this burden (Smith et al. 1999; WHO 2002). Contaminated air, food and drinking-water are particular environmental factors affecting children in developing regions of the world (Abalak et al. 2001; Smith et al. 2000). An estimated 1.7 million deaths a year globally are attributed to unsafe water, sanitation and hygiene; nine out of ten of these deaths occur in children and nearly all of these occur in developing countries (Prüss-Ustün and Corvalán, 2006). Although the traditional infectious disease threats to children’s health have largely been controlled in most industrialized countries by advances in water treatment, immunizations, waste disposal and the provision of adequate food (Suk et al. 2003), diseases such as asthma, leukaemia and cancer, learning disabilities, and congenital malformations are increasing in children in western Europe (Landrigan et al. 1998; Richardson et al. 2005; Simoni et al. 2005). Even if most of the deterministic processes leading to these diseases are multifactorial, there is increasing evidence that these diseases are influenced by environmental factors. Exposure to air pollution, lead, chemicals and noise has been shown to impair children's health and their cognitive development (Bellinger 2004; Niemann et al. 2005; Schwartz 2004). Despite the fact that the European Region contains some of the world's wealthiest countries, widening health inequalities remain the principal determinant of mortality (Anonymous 2005) illustrated by the fact that almost 140 million (16%) people in the World Health Organization (WHO) European region do not have a household connection to a drinking-water supply, 85 million (10%) do not have improved sanitation and over 41 million (5%) do not have access to a safe drinking-water supply (Anonymous 2005). From a burden perspective, injury is responsible for 23% of all deaths and 19% of disability-adjusted
life-years (DALYs) in 0–19 year-olds in the WHO European Region and has the largest environmental burden for children compared to outdoor/indoor contaminants, water sanitation and hygienic issues, or lead contaminants (Valent et al. 2004).

The Fourth Ministerial Conference on Environment and Health, held in Budapest, Hungary in June 2004 (‘The Budapest Conference’), focused on “The future for our children”, recognizing the need to address the rights of children, their health, and their particular vulnerability towards environmental risks, as well as to respond to emerging environmental concerns. The Declaration from the Conference reaffirmed that the Environment and Health Information System (EHIS) is an essential tool for policy-making relevant to children’s environmental health (WHO Regional Office for Europe 2004b).

The Budapest Conference through its Declaration adopted the Children’s Environment and Health Action Plan for Europe (CEHAPE), an international instrument negotiated with Member States to develop and manage environmental health indicators. CEHAPE sets four Regional Priority Goals (RPGs) which encapsulate key themes for action on children's health in relation to environmental factors. These are:

1. gastrointestinal health related to safe water and adequate sanitation;

2. healthy and safe transport, mobility and home environment to reduce injuries and enhance physical activity;

3. respiratory health and clean air; and

4. health through environment free of hazardous chemicals, physical and biological factors.
Although the RPGs do not explicitly cover social indicators, the CEHAPE recognizes these factors are critical in determining a child’s possible increased exposure or vulnerability to a number of environmental factors.

Reliable information is essential for prioritizing actions related to environmental exposures and their health effects as well as for monitoring the effectiveness of the actions taken. Currently, this information is widely scattered and difficult to obtain on international and national levels. Where it does exist, its contents and format are often inappropriate for international comparisons, for policy support or for public communication. Providing decision-makers with appropriate information regarding health effects attributable to environmental risks is of crucial importance. They require information about the issues of concern and an indication of the hazards and the risks that need to be addressed (Briggs 2003). Such information should enable them to assess the implications of their decisions, compare the potential effects of different decisions and choices and ultimately develop effective prevention strategies (Corválan et al. 2000). Such information includes environmental quality guidelines based on epidemiological and toxicological studies (e.g. WHO air quality guidelines; WHO 2006a). Overall, the information needs to be clear, concise, relevant and powerful (Briggs 2003).

WHO has been coordinating the development of methods and tools for a pan-European EHIS to support policy-making since 1999. In particular, the development of environmental health indicators – the EHIS central element – has been significantly advanced through a series of projects in collaboration with relevant international organizations. The project Development of Environment and Health Indicators for European Union (EU) countries (ECOEHIS), co-funded by the Directorate-General for Health and Consumer Protection (DG SANCO) of the European Commission (EC) and coordinated by WHO, was a part of this process and resulted in the proposal of 17 core
indicators under 6 themes for monitoring the EU population’s exposure to environmental hazards, their health effects and related policy actions (WHO Regional Office for Europe 2004a; Kim et al. 2005).

The Declaration from the Budapest Conference reaffirmed that the EHIS is an essential tool for policy-making relevant to children’s environmental health. The development and application of indicators focusing on children’s environmental health and facilitating monitoring and evaluation of the environmental health risks and the effect of interventions has become a significant objective (WHO Regional Office for Europe 2004b).

An international project, Implementing Environment and Health Information System in Europe (ENHIS), co-funded by the EC and coordinated by WHO Regional Office for Europe, developed a prototype of an evidence-based system to support children’s health and environmental policies in the European Region. Among the key products is a core set of children’s environmental health indicators to monitor the implementation of the CEHAPE with a prototype pan-European EHIS. This paper reports the process and products of the ENHIS project related to developing children’s environmental health indicators.

**METHODS**

A working group was convened comprising a core group of international experts representing each of the technical areas identified by the RPGs, plus a network of invited experts in each of the fields. This group carried out the following tasks: determine the needs of current and future environmental health policies; define the scope and target of the indicators; produce the methodological guidelines for each of the indicators; pilot test the indicators and then further refine the indicators; and select a core set of indicators for pilot implementation. During the process the group was primarily concerned with the need to select reliable indicators for which there was evidence in published literature that
a clear health link exists between the environmental exposure and health outcome while allowing comparison in the framework of the implementation of the CEHAPE. However, the group was mindful of the need not to place too much of a reporting burden on countries and therefore where possible to prioritize indicators for which routine monitoring and published data was readily available in most countries.

The indicators were designed to:

- enable monitoring of children’s environmental health risks, their determinants and effects of the intervention;
- provide appropriate information to countries to monitor the state of children’s environmental health, allow trends to be established and to support national policies and action programmes;
- provide a sustainable basis for reporting and dissemination of evidence-based information (i.e. there is a policy need plus there is an established link between the exposure and health outcome) on children’s environmental health avoiding duplication and ensuring continuity;
- provide a basis for improvement of existing monitoring and surveillance systems by pointing out priority data gaps in order to inform policy-making decisions.

**Overall process of development of the indicators**

Based on these criteria the process of development of the indicators was initiated. In order to present the links between environment, health outcomes and actions the DPSEEA framework developed by Corvalán et al. (1996) was used. This defines driving forces (D), that lead to pressures on the environment (P), which in turn change the state of the
environment (S), resulting in human exposures (Ex) and then to health effects (E). Actions (A) can be taken at any point during the chain in order to mitigate health effects.

The scope of indicators developed for the current project focused on exposure (Ex), health effects (E), and policy actions (A) within the conceptual framework of cause-effect proposed by WHO (1999). The process of development is detailed in the following sections and summarised in Figure 1.

**Initial selection of candidate indicators**

The working group undertook to assess the information needs of European environmental health policies by identifying the requirements of relevant legislation and guidelines such as the Protocol on Water and Health (WHO Regional Office for Europe 2004c). This was done through the development of a questionnaire on current and planned children’s environmental and health policies at EU and domestic levels for the creation of an inventory. The questionnaire was sent to national collaborating centres of the ENHIS project and was completed by public health and environmental officials or national experts in the existing policies. The topics that were identified as policy priorities from this process were: water and sanitation, noise, air pollution (including environmental tobacco smoke – ETS), housing (including injuries), transport, and radiation. Social determinants were also considered as important but these are not included in the key themes of CEHAPE and it was eventually decided not to include social indicators in the project.

To address the assessment of the information needs of European environmental health policies performed by the working group, a review of the scientific literature of the links between environmental factors and health effects was performed and experts were invited
to propose a series of indicators of relevance to the RPGs regardless of data availability and existence of methodology sheets.

The review of policy needs of information identified topic areas for which no clear regulatory framework exists. Examples include drinking-water safety, ensuring safe transport and mobility, counteracting obesity, indoor air quality. The policy measures with clear legal and regulatory context are dedicated mainly to environmental protection and improvement of environmental quality. Furthermore, these policies do not cover the range of harmful health effects, in particular on children’s health, resulting from exposure to a regulated environmental substance.

These considerations guided the working group to select environmental public health thematic issues for which policy indicators needed to be developed. The working group sought to develop policy indicators to provide a snapshot of the measures put in place in countries to reduce and prevent hazardous exposures and related health effects in children. At the same time the analysis of the policy indicators would identify policy gaps i.e. areas which are not addressed by current policy measures.

Policy indicators were conceived as a composite index across a set of policy actions using a simple equal-weight linear model. To obtain the index, each individual policy measure was scored with the following options: 0; not existing, 1; partly existing, 2; clearly stated and implemented across the country.

As there is no consensus or many systematic reviews on policy actions’ interventions, international health regulation documents were checked to select the policy components for the composite measure. These included: WHO Framework Convention on Tobacco Control (WHO 2003a), European Strategy for Tobacco Control (WHO Regional Office for Europe 2002), First Action Plan for Food and Nutrition Policy (WHO Regional Office for Europe 2001), European Child Safety Alliance (2004b), Child Safety Action Plan
Project (European Child Safety Alliance 2004a), CEHAPE programme and related table of actions (WHO Regional Office for Europe 2005).

This process resulted in 164 indicators (including those that had already been tested in the ECOEHIS project). The phase of reducing the number of indicators then began through a series of expert working group consultations. Initially, indicators which had already been tested and recommended by the ECOEHIS project and that could be adjusted to meet the requirements of CEHAPE were selected. In addition, new indicators which corresponded to emerging policy and health priorities covered by the RPG action items of the CEHAPE were selected and developed. The proposed indicators were screened according to their policy relevance, health relevance and potential data availability including a review of published literature linking environmental factors and health outcomes as well as using the results from the policy questionnaire described above.

Each indicator was assessed in terms of its credibility (i.e. based on a knowledge link between environment and health taking into account uncertainties), basic information on the definition, calculation method, interpretation and potential data sources. The process and contents of assessments were recorded. It is acknowledged that there is scientific uncertainty in environmental health that needs to be reduced. During the process of selecting the indicators published literature was screened to assess the scientific credibility of the available data. Within these criteria the indicators were either set aside or accepted for development. This assessment reduced the number of proposed indicators to 116.

*Methodology sheets*
In order to ensure the information collected on the proposed indicators was consistent and user-friendly, a template for a methodology sheet used in the ECOEHIS project was adopted (Table 1).

Through the development of methodology sheets for each indicator, it became apparent that in the case of 44 indicators there was insufficient data available to continue development. These indicators were put aside, despite being considered potentially useful for the future.

To avoid duplication and assure continuity of developmental work, the indicators tested and proposed in ECOEHIS project were reviewed for their relevance to children’s environmental health. Eleven indicators from the core indicators selected in the ECOEHIS project were adopted on the basis of their relevance to children's health and the availability of data.

**Adjustment and screening of the indicators**

Further review of the indicators was undertaken by Member States and technical experts, until a final list of 29 core indicators was produced. The primary reason for rejecting proposed core indicators at this stage was unavailability of data from international sources. Nine indicators that were rejected from the core set were retained for future use and were termed extended set. These indicators were deemed to be highly relevant to children’s health but at present the required data to compute the indicator do not exist.

Prior to finalization of the 29 core indicators, 8 indicators remained where the experts were still uncertain about their feasibility and applicability: those which had not been evaluated in the ECOEHIS project. It was decided that these indicators should undergo an evaluation process in the countries represented in ENHIS (Austria, the Czech Republic, Finland, France, Germany, Hungary, the Netherlands, Poland, Romania, Spain). Four of
these were action indicators and four were exposure indicators. The indicators screened were: policies to promote safe mobility and transport for children; policies to reduce child unintentional injury unrelated to traffic accidents; policies to reduce child obesity; children living in homes using a hazardous source of fuel for cooking and heating; children living in proximity to heavily trafficked roads; children going to school with indoor air problems; actions to reduce children’s exposure to ultraviolet (UV) radiation; blood lead levels in young children. It was not deemed necessary to evaluate the indicators that had been developed for or adapted from the ECOEHIS project since these had already been tested. Details of the process taken to test the indicators selected for the ECOEHIS project are discussed in WHO Regional Office for Europe (2004a).

The request to evaluate the indicators was sent to officials from the ministry of health and/or environment in the participating countries together with the methodology sheet and the contact data of the national partner institution. The questionnaire that accompanied the methodology sheets focused on four criteria of evaluating indicators and data elements: data quality, usefulness (combined as one category in Table 2 and described as understandability) data availability and policy-relevance (Table 2). The responses were collected using the questionnaire from April to June 2005.

RESULTS

Screening in participating Member States

Table 2 shows a summary of the results of the screening process in eight participating Member States. The results revealed lack of data in four areas related to air pollution: the protection of children from air pollutants derived from cooking and heating facilities; the protection of children living in proximity to heavily trafficked areas; the protection of children going to schools with indoor air problems; and the protection of children from
exposure to heavy metals such as lead (expressed as blood lead levels in young children in Table 2). In addition, it was reported that there was limited data availability in relation to the indicators on actions to reduce children’s exposure to UV. However, their relevance to policy in Europe was considered to be high.

**Core set of indicators**

Tables 3–6 show the final set of children’s environmental health indicators according to the RPGs. The core indicators were deemed to be policy-relevant and readily available from international data sources with sufficient quality and comparability. The eight indicators listed under extended set were retained for future development and use.

**DISCUSSION**

The indicators developed for this project met a specific task identified by the Budapest Declaration: to address the environmental factors that most affect the health of European children (WHO Regional Office for Europe 2004b). Through the development of these indicators, the project has helped to identify and prioritize the environmental health issues that are widespread in the European Region.

The screening process which was undertaken by eight countries highlighted the national variations in data availability, policy relevance and priorities. It became clear through this process that even in this small number of Member States there are gaps in policies relating to some areas of children’s environmental health as well as available data. One such area is indoor air quality. However, indoor air is an important issue in respect to children’s environmental health specifically targeted in CEHPAE, and keeping such indicators was considered valuable to encourage efforts to collect relevant data. Although it is recognized that not all of the issues are a priority in all countries and countries should therefore
choose the indicators that best suit their priorities and conditions, including resources, when establishing their own environmental health information system, there is clearly a need to fill these gaps through the development of national or international data collection systems.

The next phase of the project (begun in November 2005) was to implement the indicators in the European Region. This is making it possible to monitor the effect of actions taken to address the environmental health issues affecting children using standardized methodologies for data collection, processing and dissemination, allowing inter- and intra-country comparisons and time trend analysis.

In the long term, the overall goal is to maintain an active and up-to-date European database of environmental health policies and data, which facilitates the development of harmonized and science-based environmental health policies across Europe and increases their accountability in population health terms. Differences between national policies will and should remain, but they should be based on different conditions and needs, rather than on the lack of information to assess their effectiveness and accountability.

The environmental health indicators developed in this project can be readily applied in most EU countries in monitoring the implementation of CEHAPE. The indicators will need to be reviewed and updated regularly in order to maintain flexibility and responsiveness. By outlining the priority data-flows in a pan-European EHIS, the core indicators will provide guidelines for the reporting on the progress of realization of four RPGs of the CEHAPE.

The development of environmental health indicators to monitor the trends in the state of European children contributes towards the objectives of the Global Initiative on CEHI launched at the WSSD in 2002, initiated by and building on efforts of the United States Environmental Protection Agency. The indicators developed and made available through
the regional pilot surveys as well as information from ongoing international surveys and reporting mechanisms will be a part of the comprehensive evidence-base towards healthy public policies to better protect the health of our children and the generations to come.

<tr>
<td>Children’s mortality due to unintentional injuries</td>
<td></td>
<td></td>
</tr>
<tr>
<td>not related to traffic accidents (health)</td>
<td>Amended from ECOEHIS.</td>
<td>Data available from the WHO Mortality database (WHO 2005). Cause-specific child mortality rates per 100 000 population for</td>
</tr>
</tbody>
</table>

Prevalence of overweight and obesity in adolescents (health) New. Data found in HBSC (Currie et al. 2004). Percentage of adolescents aged 15–19 who are: adequate weight, overweight, and obese, where: Adequate weight is defined as a body mass index (BMI) below 25 kg/m\(^2\). Overweight is defined as a BMI between 25 and 30 kg/m\(^2\).
<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>

<tr>
<td>Infant mortality due to respiratory diseases (health)</td>
<td>New.</td>
<td></td>
</tr>
</tbody>
</table>

Annual mortality rate due to respiratory diseases in children older than one month and under one year of age.

| Children’s exposure to air pollutants (exposure) | Adapted from ECOEHIS indicator. |

PM$_{10}$: Child population-weighted annual mean PM10 concentration.

PM$_{2.5}$: Child population-weighted annual mean PM$_{2.5}$ concentration.

O$_3$: Child population-weighted annual mean (of max. daily 8 h means) ozone concentration.

NO$_2$: Child population distribution of exceedance hours of air quality limit values.

SO$_2$: Child population distribution of exceedance days of air quality values.

<tbody>
<tr>
<td>Children living in homes with dampness problems (exposure)</td>
<td>Adapted from ECOEHIS indicator.</td>
<td>Percentage of children aged 0–4, 5–9, 10–14, 15–19, living in housing suffering from dampness. This indicator uses the Eurostat SILC (variable HH040) on dampness-related problems such as (a) leaking roof, (b) damp walls/floors/foundations, and (c) rot in window frames or floor; all of which could lead to or represent mould growth.</td>
</tr>
<tr>
<td>Children exposed to tobacco smoke (exposure)</td>
<td>New.</td>
<td>Percentage of children aged 0–4, 5–9, 10–14 years old daily exposed to environmental tobacco smoke. Percentage smokers among children 10–14, 15–19 years old.</td>
</tr>
</tbody>
</table>
Children living in homes using solid fuels (exposure) New. Data from international surveys e.g. Demographic and Health Surveys (Measure DHS 2007), World Health Statistics (WHO 2006c) and censuses. Data also available from the Millennium Indicator Database (UN 2006) and EUROSTAT (2007).

Percentage of children aged 0–4, 5–9, 10–14 years old living in households using: coal, wood, dung, gas or kerosene as the main source of heating and cooking fuel.

Children living in proximity to heavily trafficked roads (exposure) New.

Percentage of children aged 0–4, 5–9 or 10–14 living in proximity to heavily trafficked roads.

Extended set of indicators

Hospital admissions and emergency room visits due to
asthma in children (health) New. Number of hospital admissions or emergency room visits for asthma per 1000 children by age group.

Children going to schools with indoor air problems (exposure) New. Percentage children going to schools or day care centres with moisture damage or mould growth during the year.

Percentage children going to schools and day care centres with a ventilation < 7 l/s per person.

<td></td>
</tr>
<tr>
<td>Children exposed to harmful noise at school (exposure)</td>
<td>New. Noise map available in 2008 according to EU Directive on Environmental Noise (CEC 2002).</td>
<td>Percentage of children going to primary or secondary schools located in places that are considered to be exposed to transport (road, rail and aircraft) noises above 55 dB (A) average during school hours.</td>
</tr>
<tr>
<td>Actions to reduce children’s exposure to UV (policy)</td>
<td>New</td>
<td>This is a composite index of national efforts to improve protection of children against UV exposure.</td>
</tr>
<tr>
<td>Incidence of melanoma (health)</td>
<td>Adapted from ECOEHIS.</td>
<td>Data available from International Agency</td>
</tr>
</tbody>
</table>
Incidence of childhood leukaemia (health)

New.

Annual incidence rate of leukaemia.

Work injuries among employees under 18 (health)

Incidence rate per of work accidents with victims under age 18 per 100 000 workers. According to the severity, there are two sub-indicators:

- Nonfatal work injuries more than 3 days’ absence from work.
- Fatal work injuries.

Children’s exposure to chemical hazards in food (exposure/policy)

Dietary exposure assessment to potentially hazardous chemicals monitored in children’s food Global.
<table>

<tr>
<td><strong>Blood lead levels (BLLs) in children (exposure)</strong> New</td>
</tr>
</tbody>
</table>
Extended set of indicators

Radon levels in schools (exposure)  Distribution of annual radon levels in classrooms and inhabited rooms of kindergarten, schools and colleges. Estimated arithmetic mean, median of radon concentration. Estimated percentage (and number) of classrooms and other rooms with annual mean levels of radon above 200, 400 Bq/m$^3$. Specified at the national or regional level.

Children with hearing loss and reporting tinnitus (health) Proportion of children with hearing loss due to noise.
Figure 1. Overall process of development of the indicators
Convene working group

Undertake scoping study of needs of current and future environmental policy needs

Define scope of indicators

Scientific literature review and experts consultation

164 indicators proposed for initial screening

Initial screening by experts for policy relevance, scientific evidence and data availability – 48 indicators rejected

Development of methodology sheets – 44 indicators rejected due to lack of available data to complete the sheets

Further screening for data availability – 25 indicators rejected

47 indicators proposed

Evaluation by Member States for data availability, understandability and policy relevance. A further 10 indicators rejected

29 core indicators and 8 extended indicators
